

# GWT - DEBUGGING APPLICATION

[http://www.tutorialspoint.com/gwt/gwt\\_debug\\_application.htm](http://www.tutorialspoint.com/gwt/gwt_debug_application.htm)

Copyright © tutorialspoint.com

GWT provides excellent capability of debugging client side as well as server side code.

- During development mode, GWT Application is in Java code based and is not translated to JavaScript.
- When an application is running in development mode, the Java Virtual Machine (JVM) is actually executing the application code as compiled Java bytecode, using GWT capability to connect to a browser window.
- GWT uses browser based plugin to connect to JVM.
- So developers are free to use any Java based IDE to debug both client-side GWT Code as well as server-side code.

In this article we'll demonstrate usage of debugging GWT Client code using Eclipse. We'll do the following tasks

- Set break points in the code and see them in BreakPoint Explorer.
- Step through the code line by line during debugging.
- View the values of variable.
- Inspect the values of all the variables.
- Inspect the value of an expression.
- Display the stack frame for suspended threads.

## Debugging Example

This example will take you through simple steps to demonstrate debugging a GWT application. Follow the following steps to update the GWT application we created in *GWT - Create Application* chapter:

Step	Description
1	Create a project with a name <i>HelloWorld</i> under a package <i>com.tutorialspoint</i> as explained in the <i>GWT - Create Application</i> chapter.
2	Modify <i>HelloWorld.gwt.xml</i> , <i>HelloWorld.css</i> , <i>HelloWorld.html</i> and <i>HelloWorld.java</i> as explained below. Keep rest of the files unchanged.
3	Compile and run the application to verify the result of the implemented logic.

Following is the content of the modified module descriptor **src/com.tutorialspoint/HelloWorld.gwt.xml**.

```
<?xml version="1.0" encoding="UTF-8"?>
<module rename-to='helloworld'>
  <!-- Inherit the core Web Toolkit stuff. -->
  <inherits name='com.google.gwt.user.User' />

  <!-- Inherit the default GWT style sheet. -->
  <inherits name='com.google.gwt.user.theme.clean.Clean' />

  <!-- Specify the app entry point class. -->
```

```

<entry-point class='com.tutorialspoint.client.HelloWorld' />

<!-- Specify the paths for translatable code -->
<source path='client' />
<source path='shared' />

</module>

```

Following is the content of the modified Style Sheet file **war/HelloWorld.css**.

```

body{
    text-align: center;
    font-family: verdana, sans-serif;
}
h1{
    font-size: 2em;
    font-weight: bold;
    color: #777777;
    margin: 40px 0px 70px;
    text-align: center;
}
.gwt-Label{
    font-size: 150%;
    font-weight: bold;
    color:red;
    padding:5px;
    margin:5px;
}

```

Following is the content of the modified HTML host file **war/HelloWorld.html** to accomodate two buttons.

```

<html>
<head>
<title>Hello World</title>
    <link rel="stylesheet" href="HelloWorld.css"/>
    <script language="javascript" src="helloworld/helloworld.nocache.js">
    </script>
</head>
<body>

<h1>Debugging Application Demonstration</h1>
<div ></div>

</body>
</html>

```

Let us have following content of Java file **src/com.tutorialspoint/HelloWorld.java** using which we will demonstrate debugging capability of GWT Code.

```

package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.event.dom.client.ClickEvent;
import com.google.gwt.event.dom.client.ClickHandler;
import com.google.gwt.event.dom.client.KeyCodes;
import com.google.gwt.event.dom.client.KeyUpEvent;
import com.google.gwt.event.dom.client.KeyUpHandler;
import com.google.gwt.user.client.Window;
import com.google.gwt.user.client.ui.Button;
import com.google.gwt.user.client.ui.DecoratorPanel;
import com.google.gwt.user.client.ui.HasHorizontalAlignment;
import com.google.gwt.user.client.ui.HorizontalPanel;
import com.google.gwt.user.client.ui.Label;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.TextBox;
import com.google.gwt.user.client.ui.VerticalPanel;

public class HelloWorld implements EntryPoint {

```

```

public void onModuleLoad() {
    /*create UI */
    final TextBox txtName = new TextBox();
    txtName.setWidth("200");
    txtName.addKeyUpHandler(new KeyUpHandler() {
        @Override
        public void onKeyUp(KeyUpEvent event) {
            if(event.getNativeKeyCode() == KeyCodes.KEY_ENTER){
                Window.alert(getGreeting(txtName.getValue()));
            }
        }
    });
    Label lblName = new Label("Enter your name: ");

    Button buttonMessage = new Button("Click Me!");

    buttonMessage.addClickHandler(new ClickHandler() {
        @Override
        public void onClick(ClickEvent event) {
            Window.alert(getGreeting(txtName.getValue()));
        }
    });

    HorizontalPanel hPanel = new HorizontalPanel();
    hPanel.add(lblName);
    hPanel.add(txtName);
    hPanel.setCellWidth(lblName, "130");

    VerticalPanel vPanel = new VerticalPanel();
    vPanel.setSpacing(10);
    vPanel.add(hPanel);
    vPanel.add(buttonMessage);
    vPanel.setCellHorizontalAlignment(buttonMessage,
        HasHorizontalAlignment.ALIGN_RIGHT);

    DecoratorPanel panel = new DecoratorPanel();
    panel.add(vPanel);

    // Add widgets to the root panel.
    RootPanel.get("gwtContainer").add(panel);
}

public String getGreeting(String name){
    return "Hello "+name+"!";
}
}

```

## Step 1 - Place BreakPoints

Place a breakpoint on the first line of onModuleLoad() of HelloWorld.java

```
package com.tutorialspoint.client;

import com.google.gwt.core.client.EntryPoint;
import com.google.gwt.event.dom.client.ClickEvent;
import com.google.gwt.event.dom.client.ClickHandler;
import com.google.gwt.event.dom.client.KeyCodes;
import com.google.gwt.event.dom.client.KeyUpEvent;
import com.google.gwt.event.dom.client.KeyUpHandler;
import com.google.gwt.user.client.Window;
import com.google.gwt.user.client.ui.Button;
import com.google.gwt.user.client.ui.DecoratorPanel;
import com.google.gwt.user.client.ui.HasHorizontalAlignment;
import com.google.gwt.user.client.ui.HorizontalPanel;
import com.google.gwt.user.client.ui.Label;
import com.google.gwt.user.client.ui.RootPanel;
import com.google.gwt.user.client.ui.TextBox;
import com.google.gwt.user.client.ui.VerticalPanel;

public class HelloWorld implements EntryPoint {

    public void onModuleLoad() {
        /*create UI */
        final TextBox txtName = new TextBox();
        txtName.setWidth("200");
        txtName.addKeyUpHandler(new KeyUpHandler() {
            @Override
            public void onKeyUp(KeyUpEvent event) {
                if(event.getNativeKeyCode() == KeyCodes.KEY_ENTER)
                    Window.alert(getGreeting(txtName.getValue()));
            }
        });
        Label lblName = new Label("Enter your name: ");

        Button buttonMessage = new Button("Click Me!");

        buttonMessage.addClickHandler(new ClickHandler() {
            @Override
            public void onClick(ClickEvent event) {
```

## Step 2 - Debug Application

Now click on **Debug application** menu and select **HelloWorld** application to debug the application.

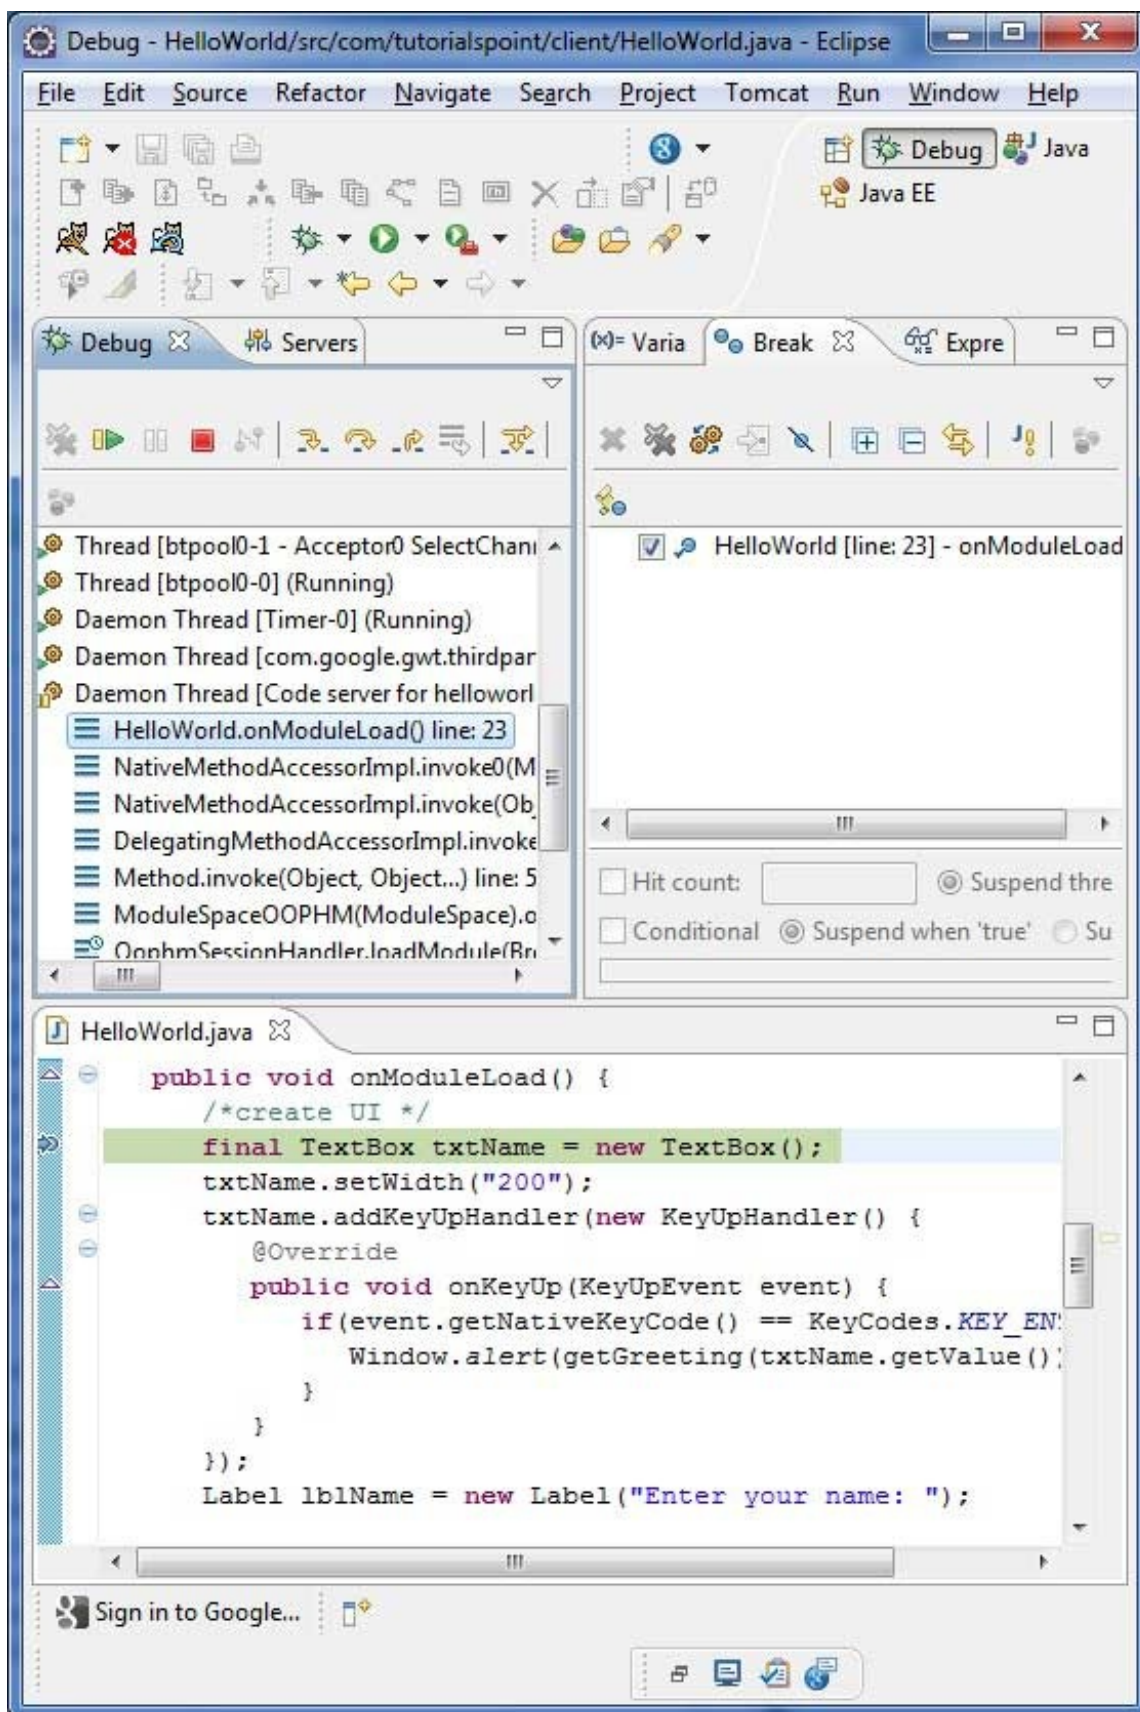

If everything is fine, you must see GWT Development Mode active in Eclipse containing a URL as shown below. Double click the URL to open the GWT application.

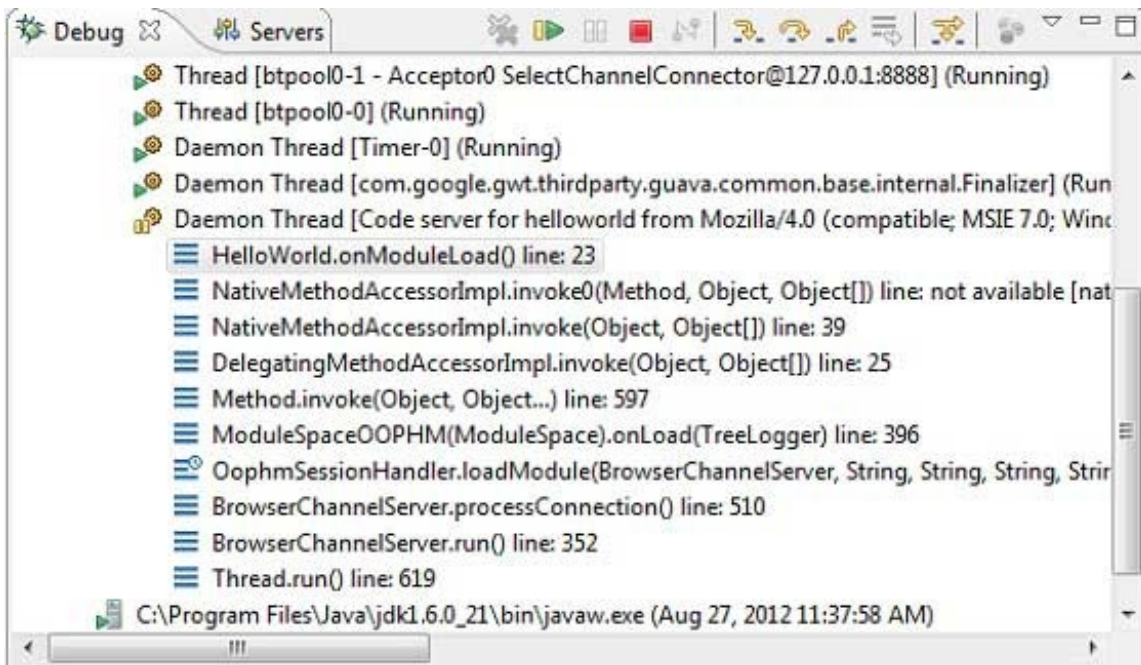

As soon as Application launches, you will see the focus on Eclipse breakpoint as we've placed the breakpoint on first line of entry point method.

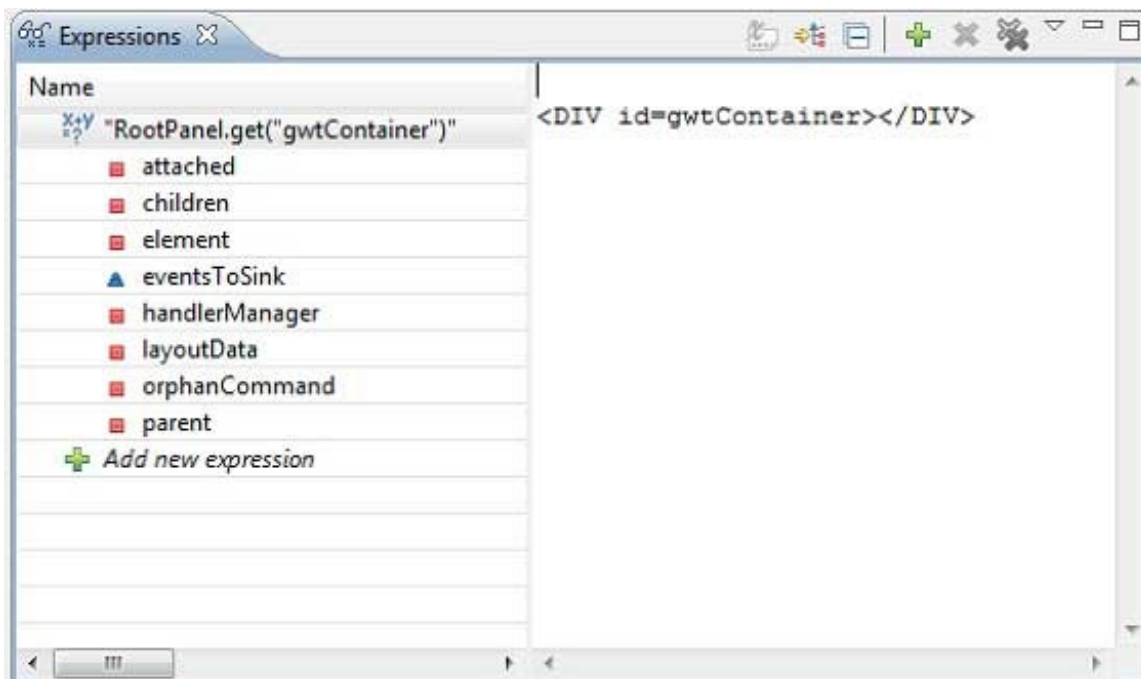

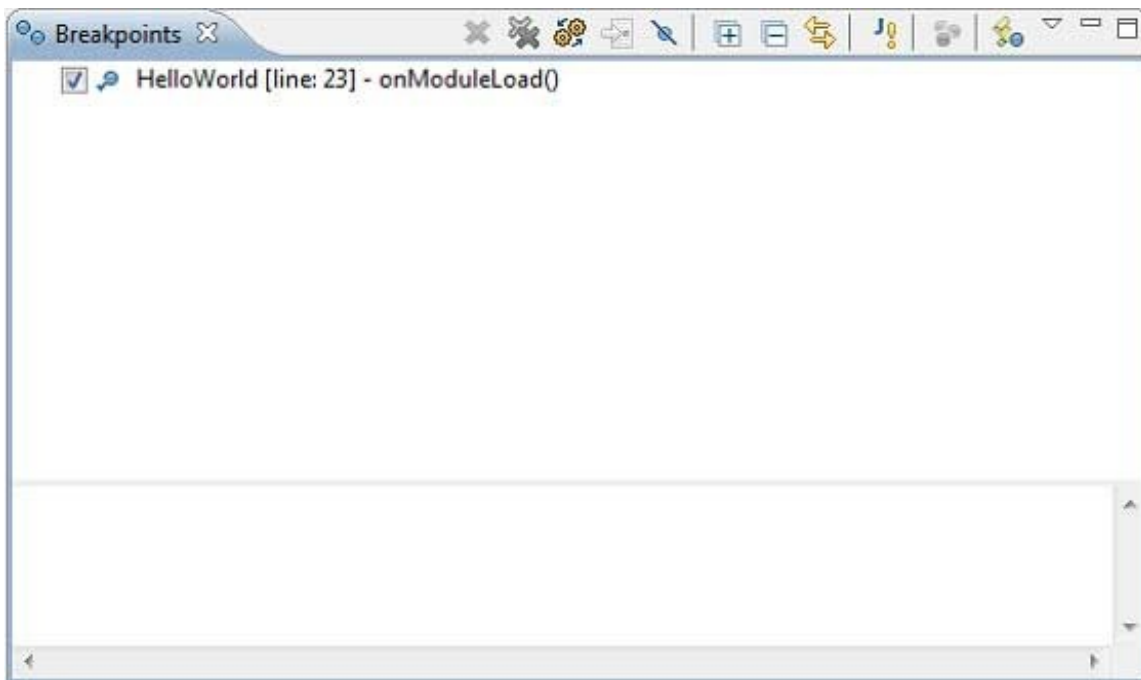

You can see the stacktrace for suspended threads.

You can see the values for expressions.

You can see the list of breakpoints placed.

Now keep pressing F6 until you reach the last line of onModuleLoad() method. As reference for function keys, F6 inspects code line by line, F5 steps inside further and F8 will resume the application. Now you can see the list of values of all variables of onModuleLoad() method.

Name	Value
this	HelloWorld (id=36)
txtName	TextBox (id=169)
attached	false
autoDirHandler	AutoDirectionHandler (id=252)
currentEvent	null
element	JavaScriptObject\$ (id=256)
eventsToSink	512
handlerManager	HandlerManager (id=257)
layoutData	null
parent	HorizontalPanel (id=227)
parser	PassthroughParser (id=260)
renderer	PassthroughRenderer (id=263)
valueChangeHandlerInitialized	false
lblName	Label (id=212)
buttonMessage	Button (id=219)
hPanel	HorizontalPanel (id=227)
vPanel	VerticalPanel (id=236)
panel	DecoratorPanel (id=245)

com.tutorialspoint.client.HelloWorld@1b79cfa

Now you can see the GWT client code can be debugged in the same way as a Java Application can be debugged. Place breakpoints to any line and play with debugging capabilities of GWT.
