Copyright © tutorialspoint.com

A JSP can be used with an HTML form tag to allow users to upload files to the server. An uploaded file could be a text file or binary or image file or any document.

Creating a File Upload Form:

The following HTML code below creates an uploader form. Following are the important points to be noted down:

- The form **method** attribute should be set to **POST** method and GET method can not be used.
- The form **enctype** attribute should be set to **multipart/form-data**.
- The form **action** attribute should be set to a JSP file which would handle file uploading at backend server. Following example is using **uploadFile.jsp** program file to upload file.
- To upload a single file you should use a single `<input .../>` tag with attribute `type="file"`. To allow multiple files uploading, include more than one input tags with different values for the name attribute. The browser associates a Browse button with each of them.

```
<html>
<head>
<title>File Uploading Form</title>
</head>
<body>
<h3>File Upload:</h3>
Select a file to upload: <br />
<form action="UploadServlet" method="post"
      enctype="multipart/form-data">
<input type="file" name="file" size="50" />
<br />
<input type="submit" value="Upload File" />
</form>
</body>
</html>
```

This will display following result which would allow to select a file from local PC and when user would click at "Upload File", form would be submitted along with the selected file:

```
File Upload:
Select a file to upload:
```

NOTE: Above form is just dummy form and would not work, you should try above code at your machine to make it work.

Writing Backend JSP Script:

First let us define a location where uploaded files would be stored. You can hard code this in your program or this directory name could also be added using an external configuration such as a **context-param** element in web.xml as follows:

```
<web-app>
....
<context-param>
  <description>Location to store uploaded file</description>
  <param-name>file-upload</param-name>
  <param-value>
    c:\apache-tomcat-5.5.29\webapps\data\
  </param-value>
</context-param>
....
</web-app>
```

Following is the source code for UploadFile.jsp which can handle multiple file uploading at a time. Before proceeding you have make sure the followings:

- Following example depends on FileUpload, so make sure you have the latest version of **commons-fileupload.x.x.jar** file in your classpath. You can download it from <http://commons.apache.org/fileupload/>.
- FileUpload depends on Commons IO, so make sure you have the latest version of **commons-io-x.x.jar** file in your classpath. You can download it from <http://commons.apache.org/io/>.
- While testing following example, you should upload a file which has less size than *maxFileSize* otherwise file would not be uploaded.
- Make sure you have created directories c:\temp and c:\apache-tomcat-5.5.29\webapps\data well in advance.

```
<%@ page import="java.io.*,java.util.*, javax.servlet.*" %>
<%@ page import="javax.servlet.http.*" %>
<%@ page import="org.apache.commons.fileupload.*" %>
<%@ page import="org.apache.commons.fileupload.disk.*" %>
<%@ page import="org.apache.commons.fileupload.servlet.*" %>
<%@ page import="org.apache.commons.io.output.*" %>

<%
  File file ;
  int maxFileSize = 5000 * 1024;
  int maxMemSize = 5000 * 1024;
  ServletContext context = pageContext.getServletContext();
  String filePath = context.getInitParameter("file-upload");

  // Verify the content type
  String contentType = request.getContentType();
  if ((contentType.indexOf("multipart/form-data") >= 0)) {

    DiskFileItemFactory factory = new DiskFileItemFactory();
    // maximum size that will be stored in memory
    factory.setSizeThreshold(maxMemSize);
    // Location to save data that is larger than maxMemSize.
    factory.setRepository(new File("c:\\temp"));

    // Create a new file upload handler
    ServletFileUpload upload = new ServletFileUpload(factory);
    // maximum file size to be uploaded.
    upload.setSizeMax( maxFileSize );
    try{
      // Parse the request to get file items.
      List fileItems = upload.parseRequest(request);

      // Process the uploaded file items
      Iterator i = fileItems.iterator();
```

```

out.println("<html>");
out.println("<head>");
out.println("<title>JSP File upload</title>");
out.println("</head>");
out.println("<body>");
while ( i.hasNext () )
{
    FileItem fi = (FileItem)i.next();
    if ( !fi.isFormField () )
    {
        // Get the uploaded file parameters
        String fieldName = fi.getFieldName();
        String fileName = fi.getName();
        boolean isInMemory = fi.isInMemory();
        long sizeInBytes = fi.getSize();
        // Write the file
        if( fileName.lastIndexOf("\\") >= 0 ){
            file = new File( filePath +
            fileName.substring( fileName.lastIndexOf("\\") ) ) ;
        }else{
            file = new File( filePath +
            fileName.substring(fileName.lastIndexOf("\\")+1)) ;
        }
        fi.write( file ) ;
        out.println("Uploaded Filename: " + filePath +
        fileName + "<br>");
    }
}
out.println("</body>");
out.println("</html>");
}catch(Exception ex) {
    System.out.println(ex);
}
}
else{
    out.println("<html>");
    out.println("<head>");
    out.println("<title>Servlet upload</title>");
    out.println("</head>");
    out.println("<body>");
    out.println("<p>No file uploaded</p>");
    out.println("</body>");
    out.println("</html>");
}
}
%>

```

Now try to upload files using the HTML form which you created above. When you would try <http://localhost:8080/UploadFile.htm>, it would display following result which would help you uploading any file from your local machine.

```

File Upload:
Select a file to upload:

```

If your JSP script works fine, your file should be uploaded in c:\apache-tomcat-5.5.29\webapps\data\ directory.
