http://www.tutorialspoint.com/junit/junit_ignore_test.htm

Sometimes it happens that our code is not ready and test case written to test that method/code will fail if run. The **@Ignore** annotation helps in this regards.

- A test method annotated with @Ignore will not be executed.
- If a test class is annotated with @Ignore then none of its test methods will be executed.

Now let's see @Ignore in action.

Create a Class

• Create a java class to be tested say MessageUtil.java in C:\ > JUNIT_WORKSPACE

```
* This class prints the given message on console.
public class MessageUtil {
   private String message;
   //Constructor
   //@param message to be printed
  public MessageUtil(String message) {
      this.message = message;
   // prints the message
   public String printMessage() {
     System.out.println(message);
      return message;
   // add "Hi!" to the message
   public String salutationMessage() {
     message = "Hi!" + message;
      System.out.println(message);
      return message;
   }
```

Create Test Case Class

- Create a java test class say TestJunit.java.
- Add a test methods testPrintMessage(),testSalutationMessage() to your test class.
- Add an Annotaion @Ignore to method testPrintMessage().

Create a java class file name TestJunit.java in C:\ > JUNIT_WORKSPACE

```
import org.junit.Test;
import org.junit.Ignore;
import static org.junit.Assert.assertEquals;

public class TestJunit {

   String message = "Robert";
   MessageUtil messageUtil = new MessageUtil (message);
```

```
@Ignore
@Test
public void testPrintMessage() {
    System.out.println("Inside testPrintMessage()");
    message = "Robert";
    assertEquals(message,messageUtil.printMessage());
}

@Test
public void testSalutationMessage() {
    System.out.println("Inside testSalutationMessage()");
    message = "Hi!" + "Robert";
    assertEquals(message,messageUtil.salutationMessage());
}
```

Create Test Runner Class

Create a java class file name TestRunner.java in C:\ > JUNIT_WORKSPACE to execute Test case(s)

Compile the MessageUtil, Test case and Test Runner classes using javac

```
C:\JUNIT_WORKSPACE>javac MessageUtil.java TestJunit.java TestRunner.java
```

Now run the Test Runner which will not run testPrintMessage() test case defined in provided Test Case class.

```
C:\JUNIT_WORKSPACE>java TestRunner
```

Verify the output. testPrintMessage() test case is not tested.

```
Inside testSalutationMessage()
Hi!Robert
true
```

Now update TestJunit in C:\> JUNIT_WORKSPACE to ignore all test cases. Add @Ignore at class level

```
import org.junit.Test;
import org.junit.Ignore;
import static org.junit.Assert.assertEquals;

@Ignore
public class TestJunit {

   String message = "Robert";
   MessageUtil messageUtil = new MessageUtil(message);

        @Test
   public void testPrintMessage() {
        System.out.println("Inside testPrintMessage()");
        message = "Robert";
        assertEquals(message,messageUtil.printMessage());
}
```

```
@Test
public void testSalutationMessage() {
    System.out.println("Inside testSalutationMessage()");
    message = "Hi!" + "Robert";
    assertEquals(message,messageUtil.salutationMessage());
}
```

Compile the Test case using javac

```
C:\JUNIT_WORKSPACE>javac TestJunit.java
```

Now run the Test Runner which will not run any test case defined in provided Test Case class.

```
C:\JUNIT_WORKSPACE>java TestRunner
```

Verify the output. No test case is tested.

```
true
```
